Application of the soil-science methods in archeological studies. G. Stobe. *Latvijas PSR Zinātņu Akad. Vestis* 1954, № 4 (pp. 31-36; 83), 21-34 (Russian summary, 34). —Soil analyses in Latvia indicated that the content of phosphates sol. in hot 20% HCl could be used to locate sites of archeological interest. The sol.-phosphate content in sites of old (100 years) homesteads was 13 times, and in old castle hills 55 times higher than in the usual forest and field soils. These differences were best seen in the top 50-cm. layer of soil. Andrew Dravnieks

✓ Ammonium bicarbonate as fertilizer. I. The dissociation pressure. Tadeusz Szczerba, Andrzej Borodzki and Zygmunt Kowalski (Univ. Krakow). Czes. Stołecznia 1, 81-6 (1957) (English summary). The problem of utilization of  $\text{NH}_4\text{HCO}_3$  (I) as fertilizer was studied. Dissociation pressure ( $P$ ) of pure I was determined between 25 and 58°. An app. similar to that of Egan, et al. (cf. C.A. 40, 8339) was used. The following mean values of  $P$  of I (in mm. Hg), and the same values reduced to degrees, were, resp., 59.4, 59.2, 25.0°; 78.0, 77.8, 27.9°; 95.9, 95.6, 20.9°; 120.4, 120.0, 34.2°; 150.8, 150.3, 37.1°; 184.7, 184.1, 39.9°; 247.4, 246.6, 43.2°; 309.3, 308.3, 49.2°; 378.4, 377.2, 48.8°; 481.2, 479.6, 53.2°; 583.4, 580.6, 54.0°; 723.7, 721.3, 57.9°. The  $P$  values were then used for calcg. the equil. reaction consts. (const.) ( $K_p$ ), the change of the standard thermodynamical potential ( $\Delta G^\circ$ ), and the heat of dissoen. ( $L$ ).  $K_p$  (in atm.<sup>-1</sup>) and  $\Delta G^\circ$  (in cal./mole) were correspondingly:  $1.75 \times 10^{-4}$ , 6199 for 25°;  $3.97 \times 10^{-4}$ , 6000 for 27.9°;  $7.37 \times 10^{-4}$ , 3750 for 30.8°;  $1.63 \times 10^{-4}$ , 5300 for 34.2°;  $3.22 \times 10^{-4}$ , 4900 for 37.1°;  $6.17 \times 10^{-4}$ , 4600 for 39.9°;  $1.20 \times 10^{-4}$ , 4200 for 41.3°;  $2.42 \times 10^{-4}$ , 3910 for 46.2°;  $4.63 \times 10^{-4}$ , 3450 for 48.9°;  $9.31 \times 10^{-4}$ , 3040 for 52.2°;  $1.65 \times 10^{-4}$ , 2670 for 54.9°;  $3.17 \times 10^{-4}$ , 2270 for 57.0°. The const. I was also examined, and its  $P$  values are tabulated. A linear change of  $\log P$  with  $1/T$  was noted. The relation can be represented by the empirical equation:  $\log P = 12.6102 - 3230/T$ , where  $T$  is abs. temp. in °K. -41.3 kcal./mole were found for  $L$ . The analogous values of Bonnier (cf. C.A. 20, 1572) and Lefèvre (cf. C.A. 50, 5385c) were 45.8 and 40.8 kcal./mole. Errors are discussed. Accuracy of the method at lower temp. was limited by the inaccuracy of pressure (0.5 mm. Hg) and at higher temps. by a given relation for which  $dP/dT = 0.03^2$ .

TITLE: Redesigned breaker for spot welding with several pulses  
PERIODICAL: Svarochnoye proizvodstvo, no. 10, 1962, 34 - 35

TEXT: In spot-welding high-strength steels three-pulse welding is used to assure high-quality production. "Heating-pause-welding-peening-tempering-cooling" is the program for martensite class steels, and "heating-pause-welding-pause-secondary welding-peening", for ferrite-austenite type steels. Three-pulse welding is carried out with the use of a redesigned series-produced ПМТ-100-2 (PIT-100-2) breaker; each pulse is separately controlled in time; current strength and pause duration. The additional breaker parts are mounted on a separate attachment and consist of a step-by-step switch with power sources, an additional relay and a block. Additional commutators and variable resistances are mounted on the control desk. The step-by-step switch contacts are parallel-connected in order to obtain a four-step switch instead of a twelve-step one. It changes over the following circuits: pause time circuits in the regulator; welding time circuits in

TITLE: A device for overexcitation of a hysteresis motor. Class 21, No. 179370

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 5, 1966, 38

TOPIC TAGS: electric motor, synchronous motor, electric hysteresis

ABSTRACT: This Author's Certificate introduces: 1. A device for overexcitation of a hysteresis motor by momentarily increasing the voltage across its terminals during start-up. The device is simplified and its reliability is increased by making it in the form of a current transformer with a tapped primary of the autotransformer type. The ends of the primary and secondary phases are connected through bridge rectifiers to noncontact switches. One of these switches is closed during start-up and the other is closed after start-up is completed. 2. A modification of this device in which silicon controlled rectifiers are used as the switches. The positive leads of these rectifiers are connected directly to the positive pole of a common direct-current source and the negative leads are connected to the negative pole through resistors with simultaneous interconnection through a capacitor.

TELEKOMUNIKACI TECHNIKA (Telecommunication Engineering, Czechoslovakia)  
Vol 12, No. 11, November, 1954

Calculation of electrical windings,  
describes a little known method for the calculation of the  
electrical windings of relays, chokes, transformers, etc. The  
method consists of determining the relationship between the turns  
and the resistance of a coil, and the resistance and number of  
turns per unit of the winding. The procedure is illustrated by  
several examples.

SOURCE: Jaderna energie, no. 4, 1965, 142.

TOPIC TAGS: nuclear reactor, radiation shielding, scintillation detector, neutron

ABSTRACT: INR Report No. 1161/1964, published in Jaderna Energie only as Czech and English summaries (modified). During the experimental evaluation of the top biological shielding of the KS-150 reactor the need arose to determine the neutron escape through the gaps around the channel shielding plugs. Fluxes behind the top biological shielding/back-up were mapped with an adapted scintillation detector and the escape values were determined. The results have been compared with integral measurements using a long counter. [JPRS]

Polarographic reduction of aromatic nitro compounds.  
D. Storesova (Charles Univ., Prague). *Collection Czechoslov. Chem. Commun.*, 14, 613-25(1969); in Eng.  
At a dropping-Hg electrode, PhNO<sub>2</sub>, m-HOC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>,  
PhNH<sub>2</sub>, and o- and p-MeOC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> are reduced in 2 steps,  
by 4 electrons to the hydroxylamine and then by 2 to the  
amine. With PhNO<sub>2</sub> at  $[H^+] = 10^{-4}$ , there is some reac-  
tion competing with step 2, perhaps the formation of  
(PhNH)<sub>2</sub>. p-HOC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> and p-H<sub>3</sub>NCH<sub>2</sub>NO<sub>2</sub> are re-  
duced in one 6-electron step probably because the RNH<sub>2</sub>-  
(OH)<sub>2</sub> is converted to a quinonoid form which has a more pos-  
itive reduction potential than the first wave. o-HOC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>  
is intermediate in behavior; at pH 6 it resembles PhNO<sub>2</sub>,  
in more acid or basic media, the first wave undergoes some  
the formation of the quinonoid form is both catalytically and  
kinetically catalyzed.

Warsaw, Farmacja Polska, Vol 22, No 9, September 1966; pp 653-658

**Abstract:** Intravenous injection of 4 mg/kg of chlorpromazine or 3 mg/kg of levomepromazine induced statistically significant rise in glycemia and potentiated hyperglycemia induced by epinephrine; it had no effect on insulin hypoglycemia nor on norepinephrine or glucose hyperglycemia. The body temperature of the animals decreased slightly following injection of the two drugs. 3 tables, 2 graphs, 2 Polish and 11 Western references.
